A key goal of ultrasound is an accurate representation of spatial characteristics of human tissues. To measure depth (range), ultrasound relies on the timing of the return

Download File

PDF The

echoes. 3 As mentioned above, ultrasound makes a number of assumptions to calculate depth. It assumes that sound travels in a straight line from the transducer to the target and back, that enough echoes are reflected back to the transducer from relevant tissue structures to be captured and measured, and that the speed of ...
